When Should You See An ENT Specialist

When do you need an ENT specialist?

Most patients are referred by their primary care doctor to an **ENT** specialist. However many patients self-refer for long-standing ear, nose and throat problems. An **ENT** specialist provides medical treatment for infections of the ears, nose, sinus and throat. As surgeons, they are trained to remove tumors, damaged and diseased structures of the face, head and neck. They also repair all the broken bones of the face.

Your ears - imagine a world where you cannot hear a newborn baby cry or enjoy listening to your favorite radio or television show. As a part of the natural aging process most adults will eventually experience hearing loss. Hearing loss and ear infections are two common problems treated by an **ENT** specialist. As a surgeon, the **ENT** specialist removes various foreign bodies from children's ears and keloids after patients have their ears pierced. They place "tympanostomy (drainage) tubes" in children and adults who have repeated ear infections. They repair torn ear lobes and ear drums which may be damaged due to infections or injury.

Your nose - imagine a world where you cannot smell your favorite foods cooking as you come home from a long day or a dozen roses delivered to your door. **ENT** specialists are responsible to treat disorders such as the persistent nasal congestion and post-nasal drip of allergic rhinitis. Specifically, they will manage the headaches, facial pain and

pressure of sinusitis which affect your nose. They fix broken noses, stop nosebleeds and repair the structures of the nose and sinus which will enable to a person to breathe.

Your throat - imagine a world where you cannot sing your favorite song or swallow your favorite dessert. An **ENT** specialist is responsible to care for all the structures of the mouth, your tonsils and larynx (voice box). As a surgeon, the **ENT** specialist removes tonsils, adenoids, thyroid glands and the vocal cords. In emergencies they insure that you have an airway to provide oxygen to your brain.

You - Do you look in the mirror and see a facial feature that you long to change? **ENT** specialists are trained to perform both the internal and external surgeries of the head and neck. As a surgeon, an **ENT** specialist can change the features of the face so that they not only compliment each other but more importantly - so that they compliment you.

Ear, Nose and Throat specialist - trained to help you look and feel your very best.
